

# WEB 303 - Javascript 2

## Assignment 6

Start with the starter files provided.

Use jQuery for any document manipulation and event binding.

Select a famous individual for your project. They can be a celebrity, athlete, politician, historical figure or fictional character. Use sources such as Wikipedia that allow you to use their content as a reference. Give credit to your sources.

**\*\* IF YOU DO NOT CREDIT(Reference) YOUR SOURCES, YOU WILL RECEIVE A MARK OF 0**

Do not choose the same person as your classmates.

You're going to be creating a "fan page" of this individual, presenting information about them and using content panels to help organize that information better. Using the starter files provided, fill them in with information about the famous individual you chose. You must incorporate the use of both an accordion AND a tabbed section to organize the information. Content can also be outside of the accordion/tabs so you can use them in a practical way. They do not need to dominate the page. Using jQuery is required but you cannot use jQuery UI.

The page must include:

- jQuery (but NOT jQuery UI) using the minified copy that is on the jQuery CDN servers
- at least one accordion, with at least 5 sections
- at least 2 tabbed section with at least 3 sections within it
- Title tag set appropriately
- text content
- images that you've saved in your project folder (and references to where you got them)
- attribution of your sources

Create your accordion and tabbed sections using jQuery and the techniques we used in the class, but the styles for each content panel must be your own (colors, sizes, borders, etc). They must still look like a function as those content panel types, but have fun with them and give them styles that you like.

When a user clicks on label in an accordion, collapse any currently visible panels in THAT accordion (not in every accordion on the page) and only display the panel associated to the label that was clicked.

Create a branch on your github repository called Assignment 6. Add your code from this assignment to your repository on that branch. In order to test your code, visit your branch on github, change the URL in the browser from github.com to githubbox.com, and it will take you to the repository in codesandbox.io.

Submit the link to your branch AND your codesandbox.io link of the code running on blackboard.

### Marks distribution (out of 10):

- jQuery and title added correctly (1)
- Content is unique and follows theme correctly. Text content and images are added and
- sourced correctly (1)
- Accordion implemented correctly (3)
- Tabbed section implemented correctly (3)
- Accordion closes content correctly when labels are clicked (2)
