WEB 303 - Javascript 2

Assignment 2

Start with the starter files provided.

When the user clicks on any of the 3 links in the `#content-wrapper` block, load the correct content into the `#content` div using AJAX.

Once the content is loaded in, animate the `div#content` to display the newly loaded html using jQuery. You can choose to use any animation available to you except for `.show()`.

When the user clicks another link, hide the 'div#content', clear its contents and load in the new content from the correct file.

You will need to use AJAX to bring in content to the index file from either the prospect, convert or retain file, based on the link the user clicks on the index page (i.e. if they click `a#prospect`, you load in the content from the prospect.html file). Use the Ajax calls into javascript, **NOT** using the ajax commands built into jQuery.

Note: To test this code, you will need to use codesandbox.io in conjunction with your github repository. (you can also use your scweb, but understand that your assignment will be marked in codesandbox.io)

Create a branch on your github repository called `Assignment 2`. Add your code from this assignment to your repository on that branch. In order to test your code, visit your branch on github, change the URL in the browser from github.com to githubbox.com, and it will take you to the repository in codesandbox.io.

Submit the link to your branch AND your codesandbox.io link of the code running on blackboard.

Marks distribution (out of 10):

- Click event is on the correct links **(2)**
- Retrieves content from the right file for each link **(1)**
- Uses ajax correctly to retrieve the content **(4)**
- Loads content onto page correctly **(1)**
- Animation works corrently after loading content and hiding content works after clicking another link **(2)**
